

CSE 540:

Engineering Blockchain Applications

Project Resources

Requirements - Ethereum

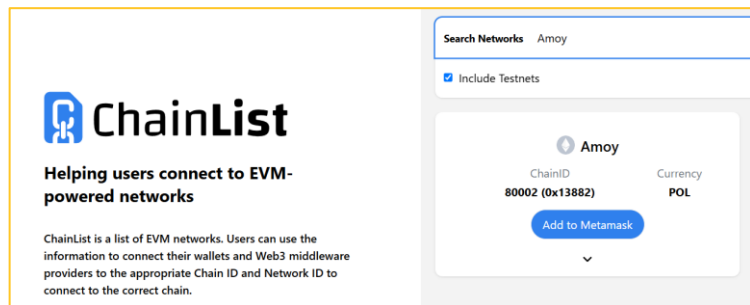

- Solidity
- Remix IDE
- Browser (Chrome, Firefox, Brave, and Edge)
- [Ethereum Developer Resources](#)

MetaMask

- To deploy a smart contract on a Polygon Amoy Network, you will first need a way to connect to a Polygon Amoy Network and pay the 'gas fees' associated with deploying smart contract.
- It is recommended to use the MetaMask browser extension (supported browsers include Chrome, Firefox, Brave, and Edge)
 - Provides an easy-to-use interface into Ethereum Networks.
 - Provides a wallet and wide-ranging interoperability with other smart contracts.
- [MetaMask Download](#)

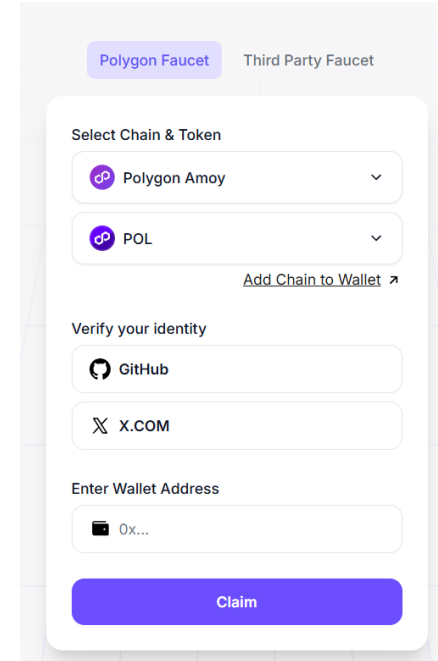

Polygon Amoy Testnet

- Testnet allows to deploy your smart contract in a live setting, without the need for real currency and other Mainnet security considerations.
- Testnets are widely used, and it is highly recommended to test and deploy smart contracts on a testnet before deploying on mainnet.
- Access [ChainList](#) add the Amoy Testnet to MetaMask.

Add Testnet Tokens

- The on-chain currency for the Polygon Amoy Testnet is POL.
- You will need POL to pay gas fees when deploying your smart contract and transacting on the Polygon Amoy network.
- Go to [Faucet](#) and enter your MetaMask wallet address to get the test tokens.

The screenshot shows the 'Polygon Amoy' faucet interface. At the top, there are two tabs: 'Polygon Faucet' (active) and 'Third Party Faucet'. Below the tabs, there's a 'Select Chain & Token' section with two dropdown menus. The first dropdown is set to 'Polygon Amoy' and the second is set to 'POL'. Below these, there's a link that says 'Add Chain to Wallet'. The next section is 'Verify your identity', which has two input fields: one for 'GitHub' and one for 'X.COM'. Below that is the 'Enter Wallet Address' section with an input field starting with '0x...'. At the bottom, there is a large blue button labeled 'Claim'.

Remix IDE and Solidity

- Remix IDE <https://remix.ethereum.org>
 - Browser-based IDE
 - Easily connects to MetaMask
 - Allow development, test, and deployment of smart contract, all directly in browser.
- Solidity documentation: <https://docs.soliditylang.org/en/v0.8.30/>

Requirements – Hyperledger Fabric

- Docker
 - Mac/Windows – Docker Desktop [<https://docs.docker.com/desktop/>]
 - Linux – Docker Engine [<https://docs.docker.com/engine/install/>]
- Docker Compose
 - Mac/Windows – Bundled with Docker Desktop
 - Linux [<https://docs.docker.com/compose/install/>]
- Go [<https://go.dev/doc/install>]
- Git [<https://git-scm.com/>]
- jq [<https://jqlang.org/>]
- CURL [<https://curl.se/>]

Windows – Use WSL

Setup - Hyperledger Fabric

- Verify that Docker has started on the system
- Create a project directory and go inside the directory
 - Optional – Inspect the script
<https://raw.githubusercontent.com/hyperledger/fabric/master/scripts/bootstrap.sh>
 - Run 'curl -sSL
<https://raw.githubusercontent.com/hyperledger/fabric/master/scripts/bootstrap.sh> | bash -s'.
It will download related docker images for the project, clone fabric-samples repo.
